

Business requirements

The Amazon project is tasked with meeting various business requirements to ensure its effectiveness and success. Central to this is the need for accurate and up-to-date information about products, necessitating the regular updating of data to reflect the latest details and availability. Flexibility is also crucial, requiring the system to adapt to changing market trends and user preferences. This adaptability extends to customization options and seamless integration with third-party services. Compliance with relevant laws and regulations is paramount, requiring regular audits and robust security measures to protect user data and transactions. Moreover, the project must prioritize a user-friendly interface, offering intuitive navigation, streamlined checkout processes, and features like wish lists for convenient item storage. By meeting these requirements, the Amazon project can ensure a positive user experience, regulatory adherence, and sustained growth in the competitive e-commerce landscape.
